Figure 3 of the GERP paper

```
#setwd("~/Documents/Github/pvpDiallel/")
knitr::opts_knit$set(root.dir=normalizePath('../'))
```

To reproduce the figures, we should set pvpDiallel as the root path, i.e. setwd("~/Documents/Github/pvpDiallel/"). And then use knitr package to get a pdf file. Or simplely click Knit PDF icon on RStudio. Note, to produce panels into seperate pdf files, we should set getpdf into TRUE (i.e. getpdf=TRUE) when calling the plotting functions.

First of all, determine fond size and set the getpdf option:

```
#par(mar=c(5,4,4,2))
par(font=2, font.lab=2, font.axis=2)
fs = 1.6 # times bigger than default
fsize = 14 # absolute font size
getpdf = TRUE # get figures in seperated pdf [TRUE] or not [FALSE]
```

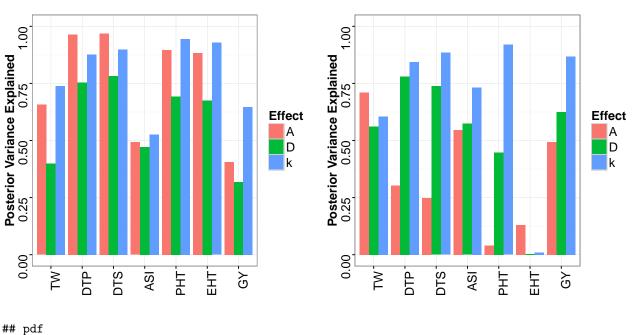

Figure 3a and 3b

```
library(ggplot2)
```

Warning: package 'ggplot2' was built under R version 3.2.4

```
